

GREEN INTERNSHIP PROGRAM – BATCH 7

Project Title: Urban Emission Hotspot Mapping

Category: Carbon Footprint Reduction / Urban Sustainability

Submitted by: Shadhana .S

Srinith .R

Sindhiya. S.T

College: Easwari Engineering College

Organization: 1M1B – One Million for One Billion

SMART Metrics Template

To create project goals that are **specific, measurable, achievable, relevant, and time-bound.**

 Section 1: SMART Goal Framework		
SMART Criteria	Guiding Questions	Your Input
S – Specific	What exactly do you want to achieve? Who is involved? What is the project about?	1. The project aims to identify and map urban carbon emission hotspots such as traffic intersections, industrial zones, and high-energy-use areas. 2. Using GPS data, open datasets, and field observations, the team will create an interactive heatmap showing locations with high emissions and propose targeted solutions to reduce the carbon footprint in those areas.

M – Measurable	How will you measure success? What metrics or data will show progress?	Success will be measured by: • Identifying and mapping at least 8–10 high-emission hotspots. • Collecting data on traffic density, industrial activity, or energy usage. • Creating a visual heatmap of emission zones. • Providing 3–5 practical emission reduction recommendations.
A – Achievable	Is this goal realistic given your resources and time? Can it be done?	1. The goal is achievable using open-source datasets, GPS mapping, simple field observations, and GIS tools. 2. A team of 3–4 members can divide tasks such as data collection, mapping, analysis, and visualization within the 35–40-hour project timeframe.
R – Relevant	Why does this goal matter? How does it align with your internship or project purpose?	1. This project supports urban sustainability and carbon footprint reduction by identifying pollution hotspots and proposing solutions like improved public transport, EV adoption, and green infrastructure. 2. It aligns with climate action goals and promotes community awareness about emissions.
T – Time-bound	What is the timeline or deadline for this goal?	The project will be completed within 35–40 hours, following this timeline: • Week 1: Data gathering and hotspot identification • Week 2: Emission analysis

		and heatmap creation • Week 3: Recommendations and project presentation
--	--	---

Section 2: SMART Goal Statement

Goal: *Write your SMART goal here in one sentence*

To identify and map 8–10 urban emission hotspots and create an interactive heatmap within 40 hours, using GIS mapping and open-source data, and propose targeted interventions to reduce carbon emissions in those areas.
